DIGITAL LITERACY PROJECT REPORT

NAME:	PRINCE TIWARI
REGISTRATION NO:	25BCY10205
BRANCH	COMPUTER SCIENCE
YEAR	2025-2029
COURSE CODE	CSE1001
DATE	29 MARCH,2026

Summary

As a newly selected Student Digital Ambassador, this project serves as a foundational exercise in navigating the digital landscape safely, professionally, and effectively. The modern academic and professional world demands more than just basic computer skills; it requires a deliberate and secure digital footprint. [cite_start]My primary objective in this project was to build a comprehensive Digital Literacy Portfolio to present to the faculty committee and share with my peers[cite: 6]. Through a series of five distinct tasks, I explored the practical applications of digital tools, established a professional online presence, practiced platform collaboration, refined my professional communication, and analyzed critical cybersecurity threats. This report documents my workflow, observations, and the key insights gained throughout the modules.

Progress Status

Task 1:

Digital Literacy Awareness Infographic

To create an engaging visual resource for my batchmates, I utilized Canva, a browser-based design tool. Given my background in content creation and video editing, I focused on designing an infographic that was both aesthetically clean and highly informative.The final design covers three crucial topics: the fundamental definition of digital literacy, essential digital tools for computer science students, and safe internet practices (specifically focusing on secure browsing environments).

The most challenging aspect of this task was condensing complex technical advice into brief, accessible bullet points that a non-technical audience could easily digest. I found it particularly interesting to balance visual hierarchy with text, ensuring that the critical safety warnings stood out immediately. Exporting the final high-resolution image reinforced the importance of using visually appealing formats for digital awareness campaigns.

Task 2:

For my digital portfolio, I established a professional presence on GitHub, LinkedIn, and Stack Overflow. I selected these three platforms because they form the core of a modern tech professional's digital identity. GitHub serves as a collaborative environment for version control and hosting code. I plan to use it extensively over the next four years to showcase my personal projects, such as full-stack network reconnaissance dashboards and custom AI agents, creating a verifiable public record of my technical skills. LinkedIn functions as a digital resume and networking hub, where I have updated my education details to reflect my current B.Tech studies. I will leverage it to connect with industry professionals, particularly in the cybersecurity space, and seek future internship opportunities. Finally, I chose Stack Overflow, a community-driven Q&A platform essential for developers. Since I frequently work with customized environments like Arch Linux and various programming frameworks, I plan to use Stack Overflow not just to find solutions to complex troubleshooting issues, but eventually to contribute back to the community by answering questions. Together, these platforms will help me transition seamlessly into the professional tech industry

Task 3:

For Task 3, I explored both coding and collaboration platforms to enhance my technical workflow. For the coding practice, I chose HackerRank, a platform widely used for algorithmic problem-solving and competitive programming. I successfully completed the 'Solve Me First' challenge using Python. For the collaboration segment, I utilized Google Workspace to design a Digital Literacy Awareness Quiz via Google Forms. I constructed exactly five questions, incorporating both multiple-choice and short-answer formats to test basic cybersecurity and digital footprint concepts. I also successfully linked the form to a Google Sheet to automatically aggregate response data. These tools will be invaluable academically; HackerRank provides a structured environment to continuously test my logic and syntax skills, which is crucial for building complex projects, while Google Forms and Sheets offer a seamless, cloud-based method for collecting and analyzing data for group assignments and research surveys

Task 4:

A classic example of poor digital communication causing significant problems is the misuse of the 'Reply All' function in professional or academic email threads. In a hypothetical scenario, a college administration sends an email to the entire student body regarding an updated exam schedule. A student, frustrated by the change, intends to complain to a friend but accidentally hits 'Reply All,' sending an unprofessional and disrespectful message to thousands of students and the faculty. This instantly damages the student's academic reputation and clutters the inboxes of the entire institution. To prevent this, the student should have adhered to basic email etiquette: always double-checking the recipient fields before sending, keeping emotions out of digital communication, and recognizing that college emails are formal environments. Implementing a brief 'cooling off' period before typing would have entirely avoided the situation.

Task 5:

While researching ransomware and digital fraud for Task 5, I was most surprised by the sheer sophistication of modern phishing vectors that deploy these payloads. I previously assumed that malicious files were obvious and easily flagged by basic antivirus software. However, learning how attackers socially engineer emails to perfectly mimic college administration alerts or legitimate software updates highlighted how easily a robust technical system can be compromised by human error. This research reinforced that security is a continuous process, not a one-time setup. As a result, the one habit I am personally changing is my backup strategy. I will no longer rely solely on cloud synchronization, which can also be compromised if the local machine is infected. Instead, I am implementing strict, isolated offline backups for all my critical code repositories and academic documents.
